

Electronic – Box for Bikes!

This electronic box is designed to be used in conjunction with small push buttons. This enables the switches to be used for turn signals, hi / lo beam and horn operation. Only four wires are needed between switches and box. Integrated is a flasher unit working independent from the drawn amperage. It will work with small marker lights with 4W – bulbs without a change of flashing frequency. All functions can be activated by a push button. Flashers are started by the first push, next push will stop or change sides by pushing on the other side. Lights will change by every push between hi- and lo – beam. A must for every custom bike as a substitute to big stock switch housings.

Technical data:

Voltage range: 12 - 16 V

Amperage: < 7 A (100 W)

Flasher control: < 0,3 A (4W)

Fuse (no circuit breaker): < 16 A

Use resistor type spark plugs!!
